## Experience

### Freelance Front-end Developer - Make Consultants

Dec 2017 - Present

Began accepting freelance proposals from numerous connections, including a previous company I was employed at, Healthy Planet. Eventually teamed up with the Make Consultants team to help source more freelance opportunities and projects.

### Senior Front End Developer - Tangerine

Nov 2016 - Present

Hired as the Marketing Department's dedicated Front-end Developer during the redevelopment of Tangerine's website. Beyond setting up development, design and QA processes and suggesting tools/software for the team I was tasked to manage, my responsibilities included creating wireframes by extending on existing designs and consequently developing modularized and sustainable front-end components using Sass/CSS, HTML and AngularJS.

Post launch of the redesigned platform, I was promoted to Senior Front-end Developer, where my onus shifted from day-to-day tasks to more large-scale projects, while still acting as a team lead for the other Front-end Developers. Such projects included leading the SEO initiative, streamlining the development process with a focus on making the team more "agile," working closely with the Data Analytics team to correct and maintain tracking on the site, implementing Accessibility standards in order to be WCAG 2.0 AA compliant, and setting up A/B tests through Google Optimize.

### Front End Developer - Sym-Tech Dealer Services

Jan 2016 - Nov 2016

Brought on to provide Sym-tech with an overall web UI identity, that was to be used in all projects moving forward. Worked with a team of backend developers in launching a web app (Sym-Tech Portal, used by 400+ dealerships) - built on MeteorJS, I was responsible for wireframing/mockup the UI and then programming the responsive front end in AngularJS, Angular Material and Sass/CSS

### Front End Developer + UI/UX/Web Designer - Gryphtech

May 2015 - Dec 2015

Hired to act as the bridge between the design and development departments. Day-to-day responsibilities/work process: meeting with product managers to determine client requirements, rounds of wireframe iterations, user interface designing and finally and development of responsive front-ends. Prominent projects: RE/MAX Redesign/Development
